EXECUTIVE SUMMARY

The State of Kansas

The four indicators that evidenced the highest percent change from the 2014 report:

- **TANF**, a 27.2% decrease in the percentage of Kansans enrolled
- **Teen pregnancy**, a 12.9% decrease in girls, ages 10-19, becoming pregnant
- **Youth binge drinking**, a 14.8% decrease in the percentage of youth engaging in binge drinking behavior
- **Uninsured children**, a 12.7% decrease in children without health insurance

Over the past decade, the State of Kansas experienced a:

- **30.3%** increase in the percent enrolled in the **National School Lunch Program** receiving free or reduced lunch.
- **24.3%** increase in **children living in poverty**
- **7.2%** increase in **high school dropout rates**
- **20.8%** increase in **Medicaid enrollment**
- **11%** increase in **non-marital births**
- **33.3%** increase in **parental unemployment** (2007 to 2013)
- **74.2%** increase in **SNAP enrollment**
- **19.7%** decrease in **Childcare Assistance enrollment**
- **3.1%** decrease in **divorce rates**
- **11.1%** decrease in **infant mortality rates**
- **4%** decrease in **low birthweight babies**
- **18.8%** decrease in **births to mothers without a high school diploma** (2004 to 2012).
- **57.6%** decrease in **enrollment in TANF**
- **34.3%** decrease in **teen pregnancies**
- **23.5%** decrease in the number of **children without health insurance** (2006 to 2013)
- **38.3%** decrease in **youth binge drinking**
- **43%** decrease in **youth tobacco use**

Kansas Counties

- Based on the composite index scores, which take into account each county's data across 18 indicators of child and family well-being, the Overall **Top 10 Kansas counties** are: 1) Greeley, 2) Johnson, 3) Nemaha, 4) Trego, 5) Pottawatomie, 6) Gove, 7) Wallace, 8) Wabaunsee, 9) Washington, and 10) Riley.
- A high overall ranking does not mean that a given county ranks highly on each individual indicator, therefore, each county has specific areas that they could target to improve child and family well-being.

A BRIEF HISTORY OF THE STATE OF THE FAMILY REPORT

In 2012, The Kansas Department for Children and Families (DCF) contracted with Kansas State University researchers to begin an analysis of child and family well-being across Kansas counties. The purpose of this project was to **provide information** through publicly-available annual reports accessible to government officials, policymakers, community leaders, faith-based organizations, helping professionals and Kansas citizens **to better understand** the state of child and family well-being in their local area **and assist** local communities target specific areas for **improving the health of children and families**. Each year, researchers at Kansas State compile and analyze data to develop a report that provides an overview of state-level trends and a county-by-county comparison on indicators of child and family well-being.

To do this, measurable indicators of child and family well-being were selected based on several criteria. First, researchers conducted an in-depth literature search of indicators of child poverty. From this investigation, a list of approximately 60 potential indicators was developed. Many of these were duplicative, so the next step was to determine which indicators could be obtained at both the state and county level. Various sources that collect county and state-level data were searched; however, only a handful of these indicators were consistently measured at the state level and even fewer at the county level. Following the narrowing of

indicators to viable measures, the list was reviewed with DCF. At the time, DCF indicated its desire to have a shorter, more concise list. A list of 14 indicators was proposed, with DCF adding TANF, SNAP, Medicaid, and Childcare Assistance to bring the total to **18 indicators of child and family well-being**. Of these 18 indicators, two are tracked only every decade (parental unemployment and single-parent household). The selected indicators reflect the needs of DCF and the availability of data at the initiation of the annual report. Although these are reputable and consistent indicators, there are many more potential indicators aside from these 18. Such additional indicators may be more salient in some counties compared to others or

may only be measured in certain counties. Each county's policymaker s and citizens should attend to

Each county's policymakers and citizens should attend to additional measures of child and family well-being unique to their own circumstances.

additional measures of child and family well-being unique to their own circumstances. In addition, evaluating outcomes of specific counties' programs and initiatives would be an important step in determining the effectiveness of these programs at the local level and are likely to provide more proximal evidence of the effectiveness of these new programs and initiatives than will the 18 indicators specified in these reports.

Various sources are used to collect this state and county-level data year by year, including the U.S. Census Bureau, KIDS Count, DCF, Kansas Department of Health and Environment, Kansas State Department of Education, and other local resources.

INDICATORS

IN ALPHABETICAL ORDER, THE 18 INDICATORS ARE:

1. Child care Assistance
2. Child Poverty
3. Divorce
4. Free And Reduced Lunch Programs
5. High School Dropouts
6. Infant Mortality
7. Low Birthweight Babies
8. Medicaid Enrollment
9. Mothers without a High School Diploma
10. Non marital Births
11. Parental Unemployment
12. Single parent Households
13. SNAP Enrollment
14. TANF Enrollment
15. Teen Pregnancy
16. Uninsured Children
17. Youth Binge Drinking
18. Youth Tobacco Use

INTRODUCTION

Each year, the Kansas Department for Children and Families and researchers at Kansas State University develop a report on child and family well-being in the state of Kansas. The purpose of this report is to provide an overview of state-level trends and a county-by-county comparison on a number of indicators of child and family well-being. This information could aid government officials, policymakers, community leaders, faith-based organizations, helping professionals, and Kansas citizens understand the state of child and family well-being in their local area and assist in helping local communities target specific areas for improving the health of children and families.

Eighteen indicators of child and family well-being are included in both the state trend data as well as the county rankings. The eighteen indicators are:

1. **Child Care Assistance**
2. **Child Poverty**
3. **Divorce**
4. **Free And Reduced Lunch Programs**
5. **High School Dropouts**
6. **Infant Mortality**
7. **Low Birthweight Babies**
8. **Medicaid Enrollment**
9. **Mothers without a High School Diploma**
10. **Non-marital Births**
11. **Parental Unemployment**
12. **Single Parent Households**
13. **SNAP Enrollment**
14. **TANF Enrollment**
15. **Teen Pregnancy**
16. **Uninsured Children**
17. **Youth Binge Drinking**
18. **Youth Tobacco Use**

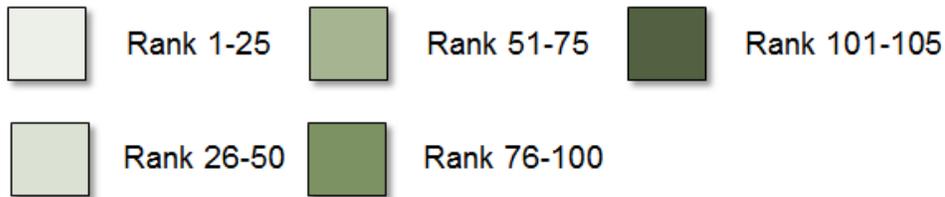

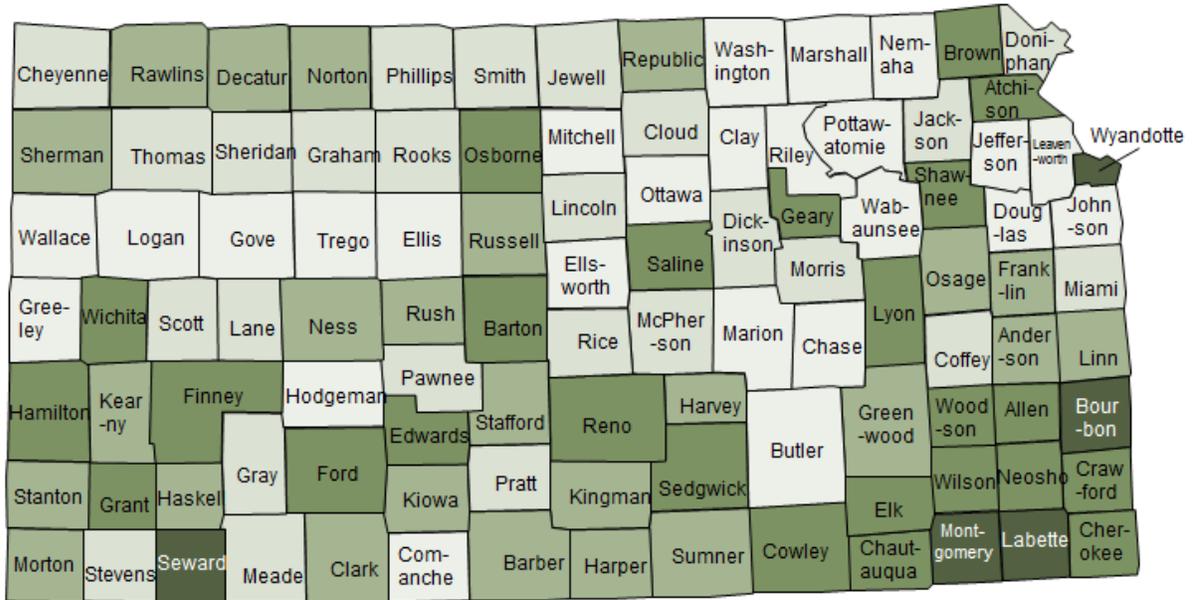

- Why rank Kansas counties? The ranking system provides an overall picture of the status of each county on these 18 indicators compared to all other counties in the state of Kansas.
- Since 2012, these annual reports have ranked counties on each of these indicators. In this 2015 report we provide an update to the Kansas county rankings.
- This update allows us to see how much counties changed from the 2014 report to the current year. The change score for each county is provided in the composite index tables.

METHOD

A composite index was developed to compare counties on multiple indicators of child and family well-being. To reduce volatility in how counties change from one year to the next on these indicators, we used three-year averages of the years 2011-2013*, which represents the most recently-available data at the county level. The Composite Index takes all indicators and pools them together, giving each county one score that can be compared across counties. First, a standardized (Z)-score was computed for each indicator for each county. To calculate the z-scores, the mean and standard deviation of the measured values for each indicator were gathered across all 105 counties. Lower z-scores represent more desired outcomes. For example, the higher the child poverty rate, the higher that county's z-score for that indicator. Second, each county's z-scores across the 18 indicators were averaged to obtain a single z-score for each county. Third, each county was ranked based on this final, averaged z-score. Finally, we compared the current ranking with the ranking provided in the 2014 report and computed the degree to which each county changed in their ranking. In addition to providing rankings for each county on the composite index, we provide rankings for each county on each individual indicator. We also reported the change score for each county on each of these individual indicators, so counties can see how they have changed on each indicator.

*If an indicator did not report data for 2013, then the most recent year's data is reported. If a county did not have data on a specific variable for a single year, the average of the existing data within the 2011-2013 range was used.

2015 COMPOSITE INDEX: Rank Order

103	Bourbon	0.901	● 0
104	Seward	1.061	● 0
105	Wyandotte	1.746	● 0

Z-scores were computed using three-year averages of the years 2011-2013. These are the most recently-available data at the county level. If a county was missing data for an indicator on all three years, that indicator was not included in the county's composite rank. Specifically, the county would have a composite rank developed from an average of 17 indicators rather than 18. Ranks range from 1 = best to 105 = worst. Repeat values in rank indicate having the same z-score value, suggesting that two counties are equivalent in their comparison to other counties. Change score refers to the change in rank from the 2014 report. In 2014, average scores from the years 2010-2012 were used. A positive value in the change score indicates that the county moved up or improved in rank, the value of the change score indicates the number of places it moved. A score of zero indicates that the county remains in the same rank as it did in 2014.

89	Cherokee	100	Ford	98	Neosho		
93	Cowley	31	Jackson	53	Osage		

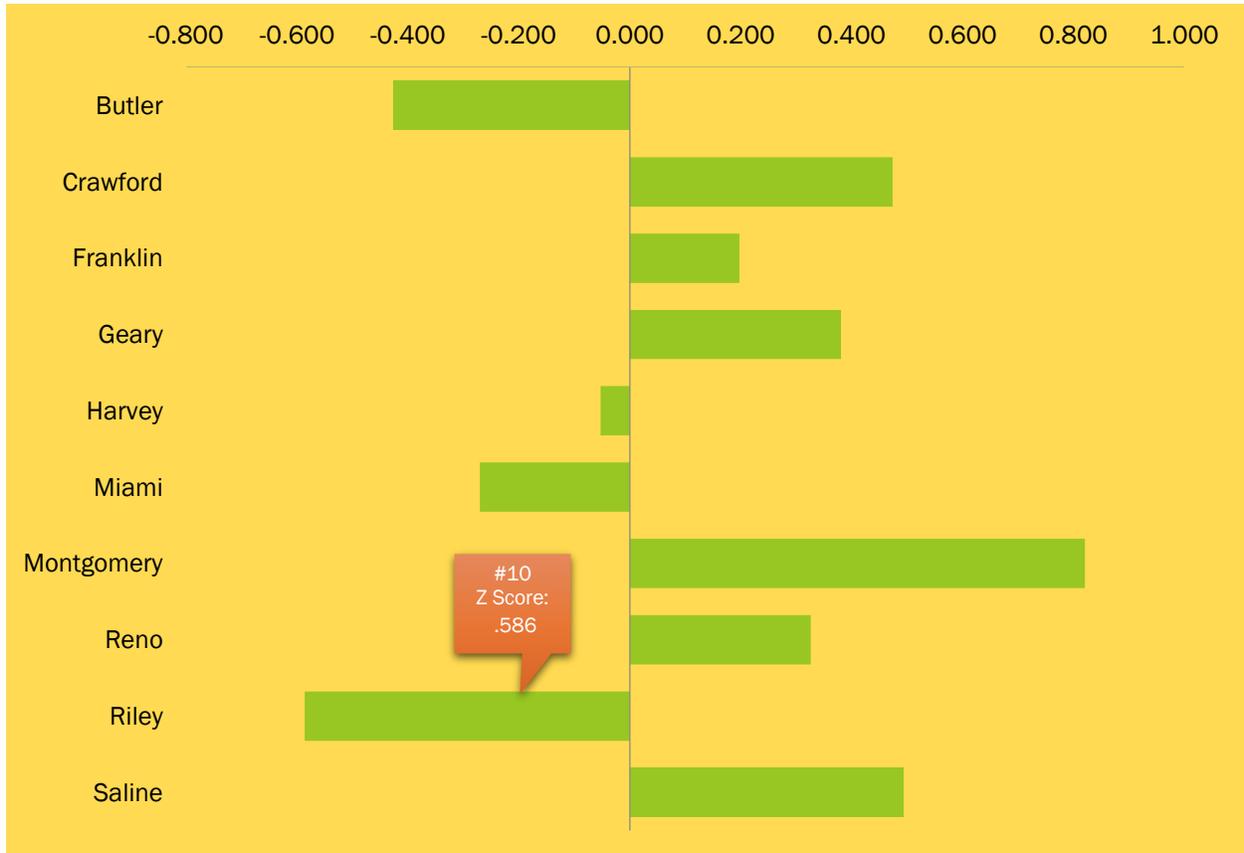

Read chart from left (best) to right (worst). A z-score of 0 means that the county was “average”. Those with a negative value were above average (to the left of the line), or better; those below (right of the line) are worse than average.

Seward County was ranked #104 last year, with a z score of .976. This year, Seward maintained its rank at #104, but had a change score of .27, indicating that although its ranking remained unchanged, it fell a bit further away from the average (z score of 0).

Semi-urban (40-149.9 persons per sq. mile)

24	Butler	84	Geary	101	Montgomery	88	Saline
85	Crawford	51	Harvey	79	Reno		
70	Franklin	33	Miami	10	Riley		

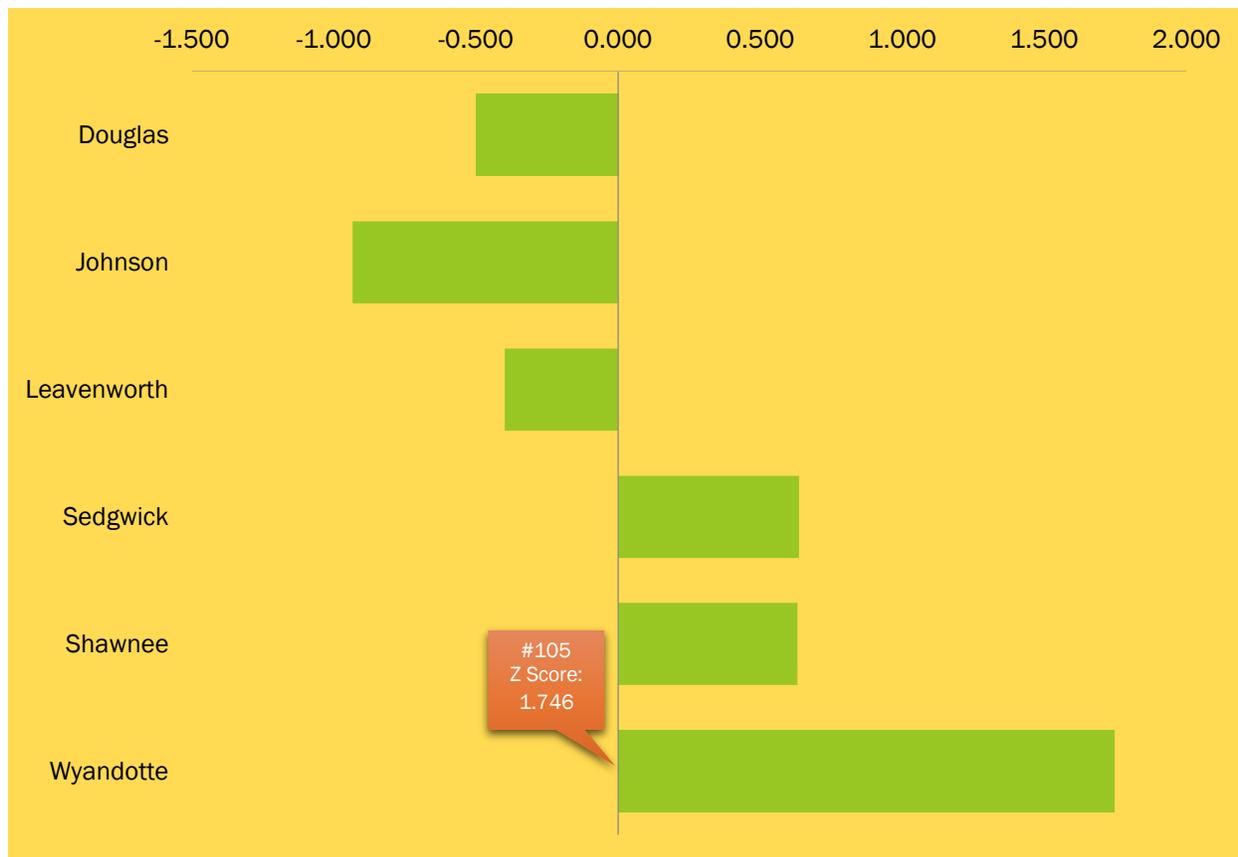

Read chart from left (best) to right (worst). A z-score of 0 means that the county was "average". Those with a negative value were above average (to the left of the line), or better; those below (right of the line) are worse than average.

Riley County, home to about 75,905 people, moved up one spot in ranking from #11 in 2014 to #10 in 2015. The composite score, however, was actually closer to the mean this year, suggesting that although its overall score was better last year, the relative rank favors them this year, with only nine counties having a higher ranking.

As population density increases, change scores are less likely to fluctuate as much from year to year. Due to the higher number of people in the population, small changes in number of enrollment in programs, births in the county, etc. will have less of an impact on the overall composite score for the county.

Urban (150 or more persons per sq. mile)

18	Douglas	25	Leavenworth	94	Shawnee
2	Johnson	95	Sedgwick	105	Wyandotte

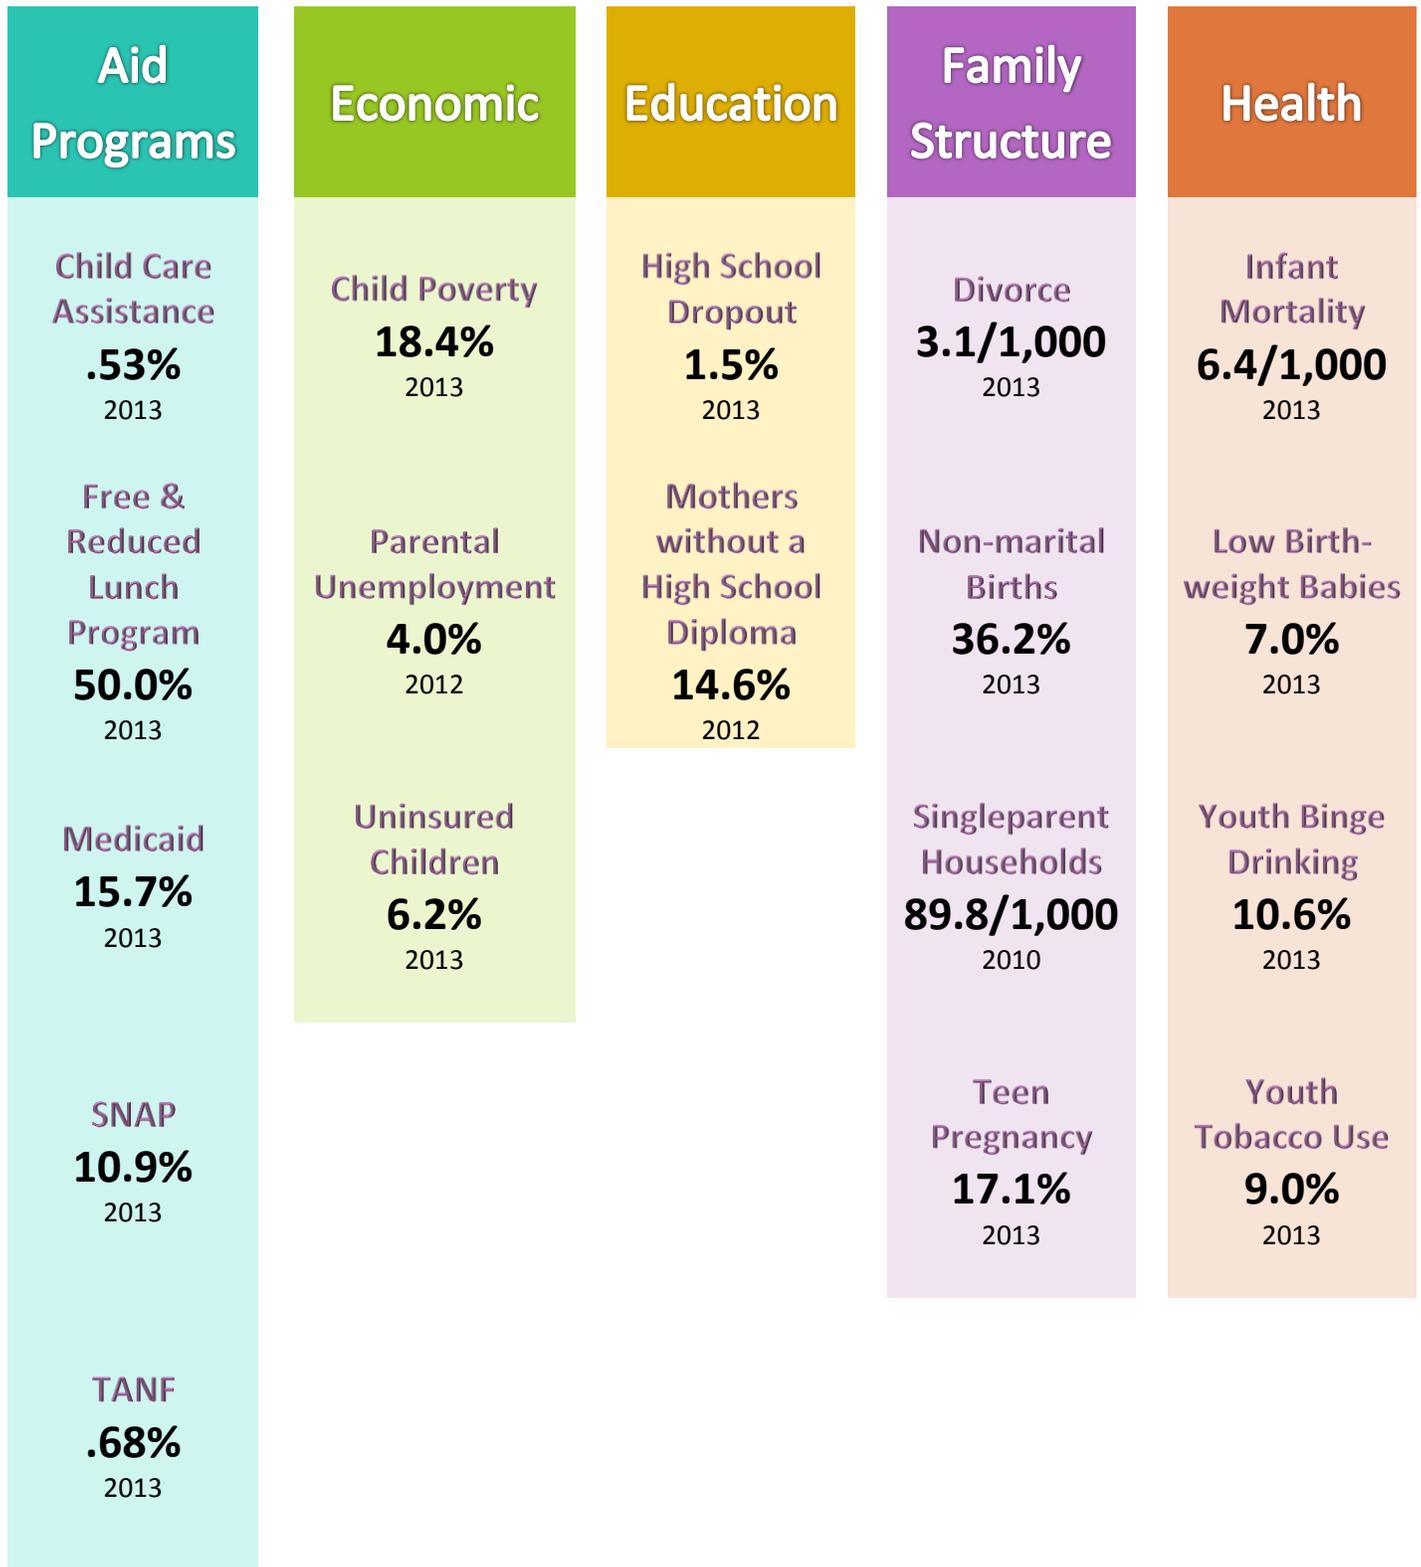

Read chart from left (best) to right (worst). A z-score of 0 means that the county was “average”. Those with a negative value were above average (to the left of the line), or better; those below (right of the line) are worse than average.

Douglas County moved three spots lower on the overall rank compared to last year, but has maintained almost the exact z score. Johnson maintained the same rank but had a z score that slightly improved. These trends demonstrate that although both measures (z scores and rankings) are in comparison to other counties, that a change in one does not necessarily mean an equal change in the other.

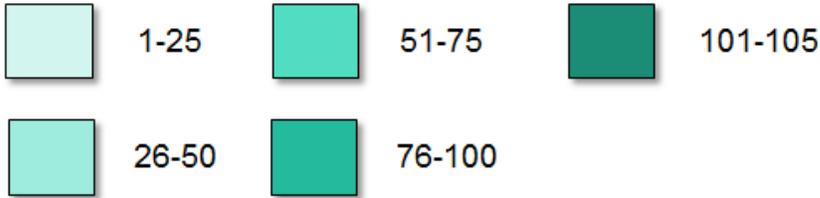

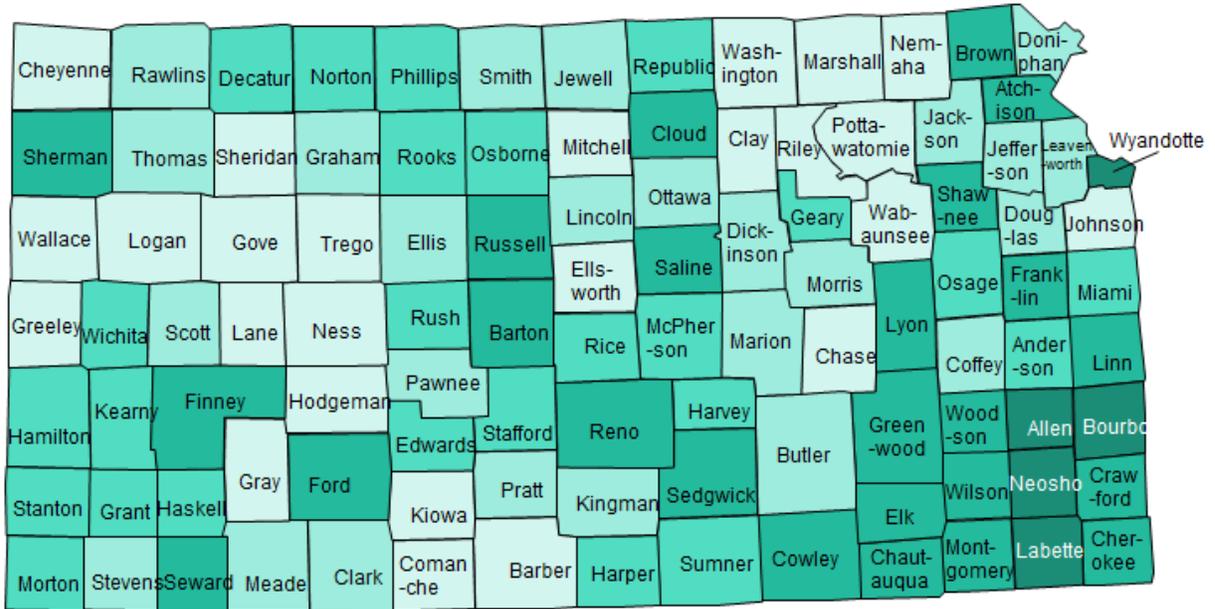

Wyandotte County ranked last using the composite ranks in 2014 and again this year in 2015. Wyandotte County ranked last on a number of specific indicators as well, including free and reduced lunch, child poverty, Childcare Assistance, non marital births, Medicaid, SNAP, and TANF enrollment. Wyandotte, however, is ranked seventh in divorce rate per population and 18th on youth tobacco use.

35	Franklin	-0.268	70	Anderson	0.129	105	Rawlins	2.031

Rankings are based on 4 indicators of health with 1 being the county with best health. Total health z-scores were developed using an average of the z-scores of the 4 indicators. Decatur, Hodgeman, and Wichita counties did not report youth binge drinking and youth tobacco use for all three years. Thus the domain composite ranking was developed using the average z-score for infant mortality and low birthweight babies.

STATE LEVEL TRENDS

In addition to the county composite index, we also report state-level trends across the 18 child and family well-being indicators. A graph displaying the trend for each indicator is provided as well as a brief discussion of state and county trends, where applicable. National trend data are also reported when provided by the same data source. To avoid misinterpretation when comparing rates, data are not reported for national trends if the definitions differed or were not obtained through the same source as the state-level data. Appendix A provides information regarding indicator definitions and data sources. Appendix B provides individual county rankings based on a three-year average of the most recent data available for each indicator. Counties with missing data for particular indicators are represented in the table with “N/A” for not available.

Child Poverty

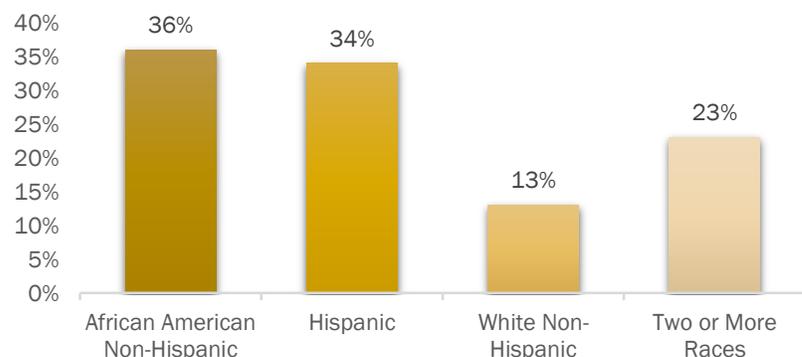

Poverty can have negative consequences for individuals of all ages; however, children in poverty experience far greater risks in terms of well-being. Poverty affects children’s cognitive, social and emotional development, health outcomes, and academic achievement.¹ The timing, duration, and intensity of poverty appear to have significant effects. For instance, children who experience poverty in early childhood have less successful outcomes than children who experience it later in childhood.¹ Ultimately, poverty in childhood is likely to impact one’s overall well-being in the future. Various factors are considered root causes of childhood poverty, including parental education, employment and marital status.²

Child poverty in Kansas is a major issue, but, relative to the rest of the United States, there is reason for optimism. The percent of children in poverty in Kansas in 2012 was 19 percent, but continues to remain below the national rate of 22 percent. The most recent year’s data (2013) shows a slight decrease in child poverty rates for both the state (18.4%) and the nation (22.2%) compared to 2012.

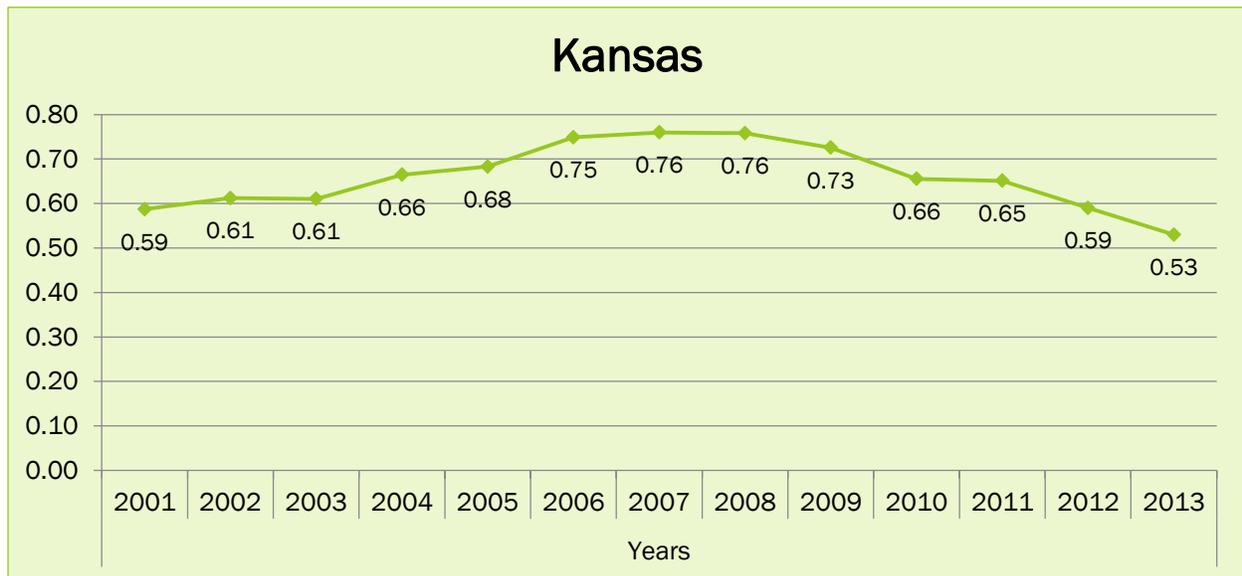

Percent of Children in Poverty by Race in 2013

U.S. Census American Community Survey

- Between 2000 and 2013, Kansas had, on average, a 3.6% lower child poverty rate than the national average.
- The rates within specific counties of Kansas range from 7.87% (Johnson) to 37.53% (Wyandotte). A full report of county level data, which has been averaged across 2011, 2012 and 2013, is available in Appendix B1, p. 63
- The five counties with the highest proportion of children in poverty were Chautauqua (28.30%), Elk (29.23%), Woodson (29.27%), Bourbon (30.60%), and Wyandotte (37.53%).

Childcare Assistance

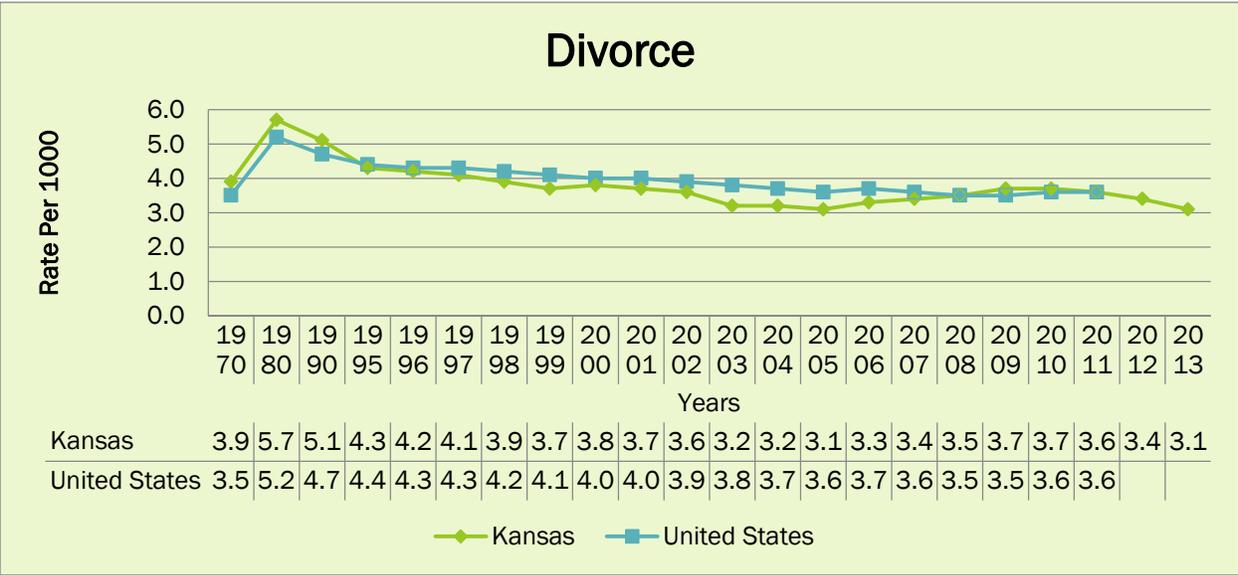

* Child Care subsidy programs differ from state to state based on income threshold, therefore, a comparison could not be made to the national rates.

Child care is exceedingly costly; for one child, center-based care may cost between \$4,000 and \$10,000 per year⁴⁹. Because of the high costs of child care, receiving Childcare Assistance is extremely important for many low-income families. Families eligible for Childcare Assistance include those who receive TANF, those who are low-income and working, those who are receiving education or training to keep or obtain a better job, and teen parents completing high school or GED. Childcare Assistance is also dependent on monthly income thresholds based on family size, thus Childcare Assistance is associated with low-income.

- County level data regarding the average percentage of the population that received child care assistance from 2011 to 2013 can be viewed in Appendix B2, p. 64.
- In 2013, an average of 15,390 Kansans received child care assistance per month.
- The 5 counties with the highest rates were Saline (.86%), Labette (.89%), Shawnee (.91%), Sedgwick (.97%), and Wyandotte (1.1%).
- Although more research is needed to assess the reason for the change in child care assistance enrollment, the fact that fewer parents are receiving child care assistance cannot be easily attributed to the parental employment rate because it was at 4% in both 2008 and 2012.

In 2013, the percent of the population that received Childcare Assistance was 0.53 percent, a 10.17 percent decrease from 2011. Furthermore, from 2008, the year with the highest enrollment rate, to 2013, there has been a 30.26 percent decrease in the percentage of individuals who received Childcare Assistance. It is important to determine the causes of these changes.

Divorce

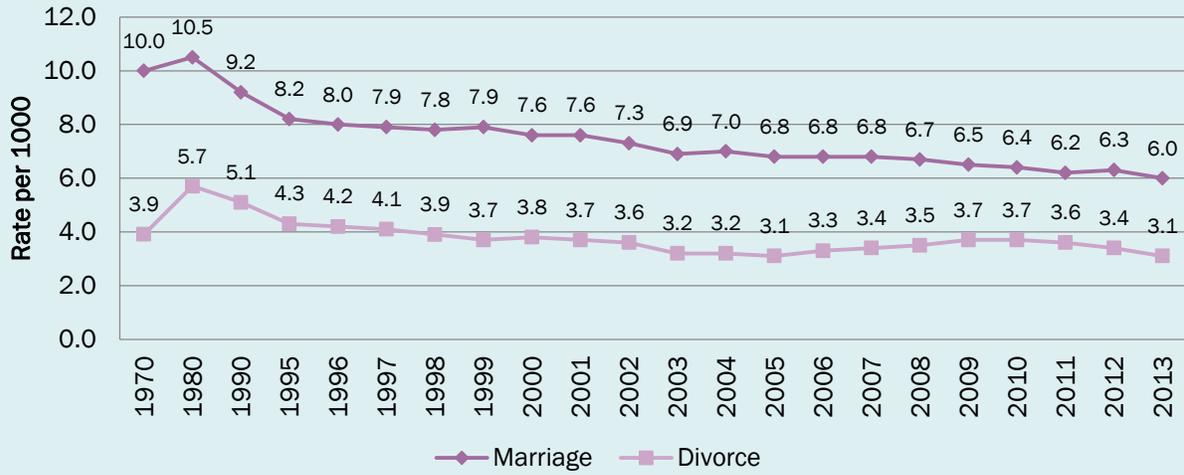

*US data may not contain all states; US 2012 and 2013 data were not obtainable at time of report

Divorce increases the likelihood that families with children will be poor by 46 percent.³ Children from divorced families are more likely to have issues with academic achievement, conduct, social competence, psychological adjustment and self-concept.^{4,5} The effects of divorce can reach across generations, affecting not only the children of divorcing parents but also divorced children’s own future offspring.⁶ Following divorce, the economic well-being of custodial mothers and their children usually decreases,⁷ with a decline of nearly 40 percent in median income for custodial-parent households.⁸ Married couples tend to have more resources, share expenses, and have greater familial support, which on average, results in better futures for children.

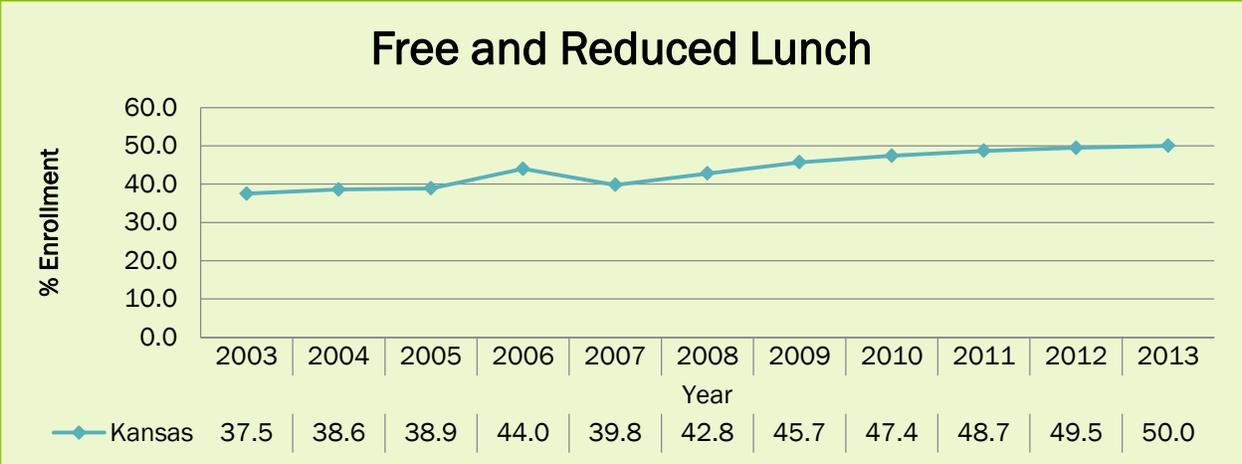

State-level data regarding divorces and annulments were obtained from 1970 to 2013. The rate of divorces and annulments was 3.1 per 1,000 people in 2013, which is substantially less than the 5.7 per 1,000 people in 1980—the year with the highest rate amongst the sample. Since 2006, the divorce rate in Kansas has not been higher than 3.7 or lower than 3.1, indicating that the divorce rate has been relatively stable. Divorce, as a possible outcome of marriage, should be considered within the context of marriage rates as well. Overall, the trend suggests that marriage rates have significantly decreased since 1970.

- Of 9,085 divorces and annulments in Kansas in 2013, about 34.5%, or 3,139, happened before the fourth year of marriage.
- 50% of marriage dissolutions in Kansas involved children.
- Based on the three year average, the rate of divorce per 1,000 was the highest in Norton (5.22), Jewell (5.24), Ellsworth (6.20), Coffey (9.85), and Geary (10.17).
- County level data using the three year average from 2011 to 2013 is reported in Appendix B3, p.65.
- Between 2011 and 2013, there were a total of 29,312 marriage dissolutions in Kansas.

Kansas Marriage and Divorce Rates

Free and Reduced Lunch

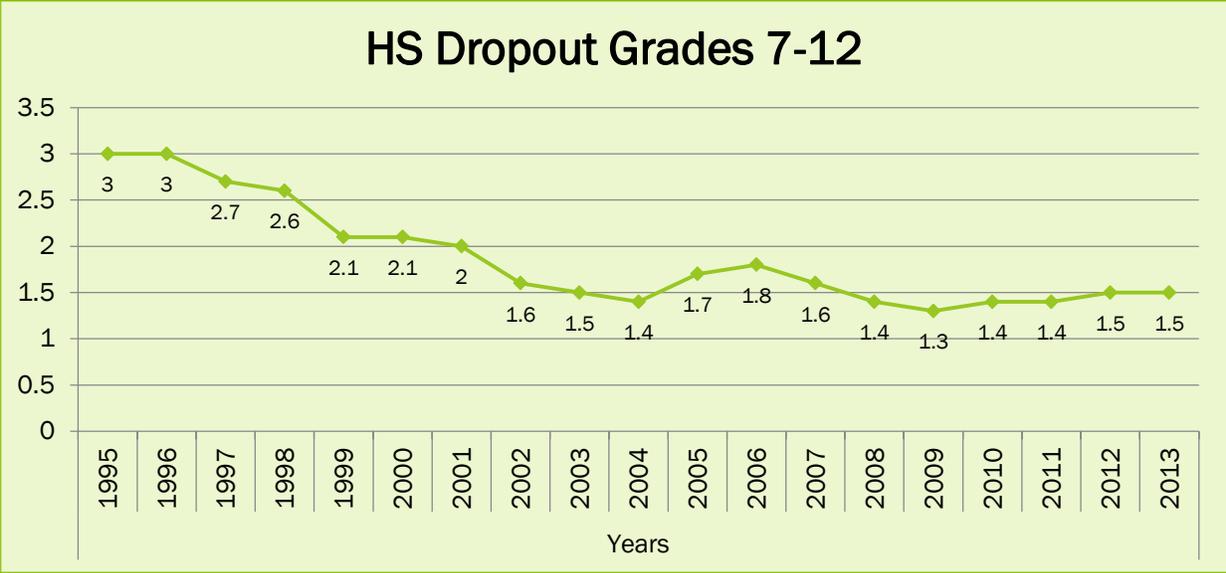

*National trend is not available as free and reduced lunch eligibility is determined by each state

The National School Lunch Program is an assisted meal program that is in place as an effort to ensure that children receive nutritious meals. Children enrolled in this program receive school lunches at either a free or reduced rate. In order to be eligible for free and reduced lunch programs, family income levels must fall within a certain poverty range.

- The five counties with the highest percentage of children enrolled in free and reduced lunch programs were Haskell (66.98%), Finney (69.51%), Seward (77.41%), Ford (77.78%), and Wyandotte (79.25%).
- County level averages using annual data from 2011 to 2013 are reported in Appendix B4, p.66.
- In 2003, 37.5% of children were enrolled in these programs. A decade later, in 2013, 50% of children were enrolled, a 33% increase.
- The percent of children enrolled in free and reduced lunch programs in Kansas has increased each year since 2007.

High School Dropout

*Rates differ from the inverse of graduation rates and cannot be compared to national rates; specifically, dropout is calculated annually by dividing the number of 7th through 12th graders who dropped out by the total number of students in those grades enrolled for that year.

- The three year averages of annual, county level data from 2011, 2012, and 2013, are reported in Appendix B5, p. 67. Eight counties had a dropout rate below 0.5% (Coffey, Nemaha, Logan, Ness, Marshall, Clark, Thomas, and Pottawatomie).
- Only one county had an average high school dropout rate exceeding 2.7% (Kiowa, 14.93%).
- Although the high school dropout rate for Kansas has been lower than the national average in each year since 2002, the distance between Kansas and the national average is closing. Between 2002 and 2006, Kansas had, on average, a dropout rate 1.7% lower than the national rate, but, between 2007 and 2011, Kansas reported a dropout rate 1.4% lower than the national rate, on average.

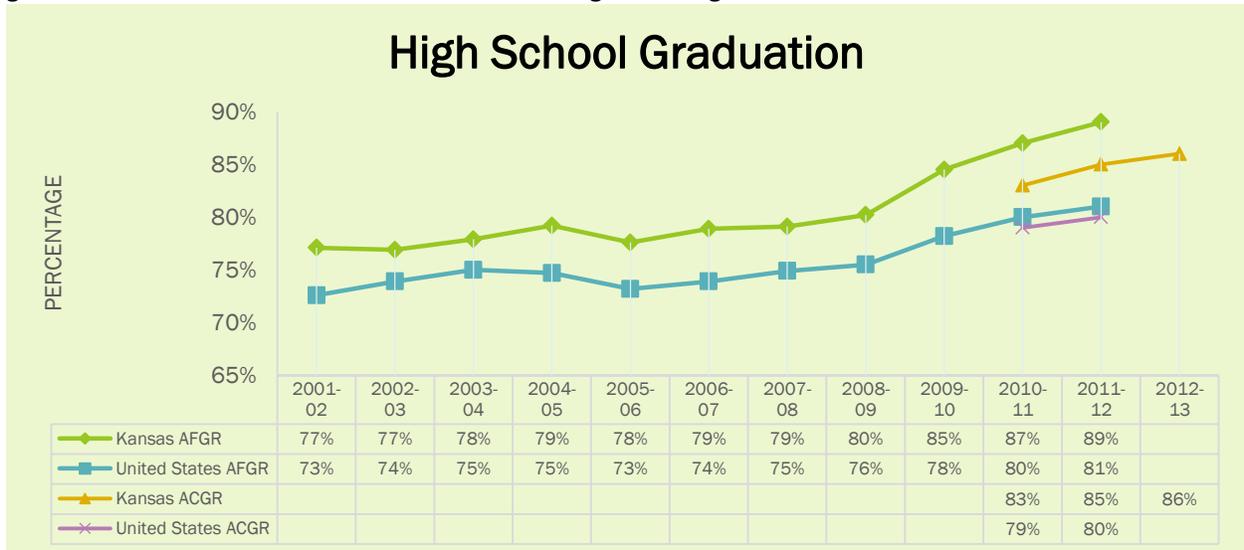

The factors that lead to high school dropout are multifaceted and may begin before children enter elementary school. The early home environment, quality of caregiving, IQ, socioeconomic status, behavior problems, academic success, parent involvement, and peer relations have all been associated with high school dropout.⁹ Students who drop out of high school are at a greater risk for unemployment, poverty, imprisonment, divorce, receiving public assistance, and having children who also drop out of school.¹⁰ Additionally, dropping out of high school costs communities

and states through a reduction in workers who can generate revenue and through the increase in social welfare assistance, incarceration, and health-care costs for high school dropouts.¹⁰

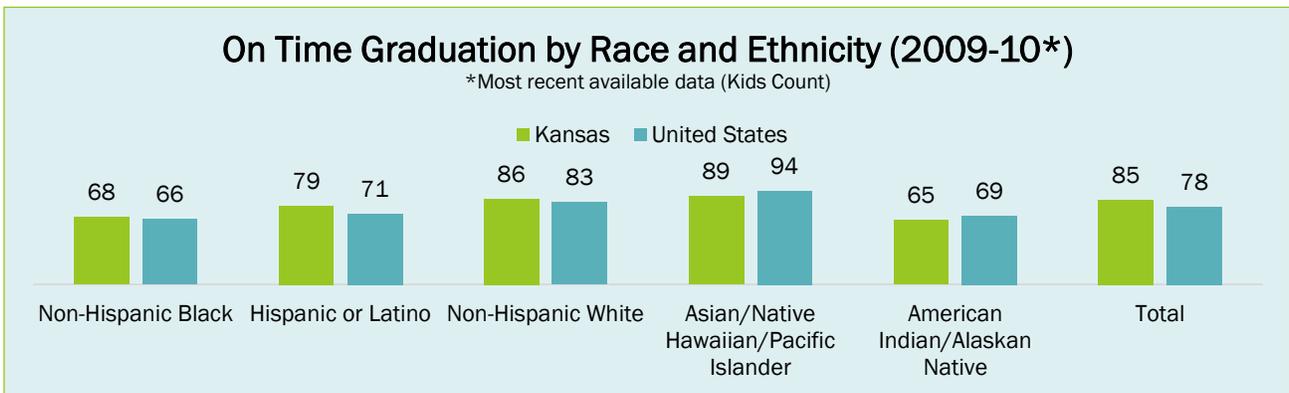

In 2013, the high school dropout rate in Kansas was 1.5 percent, which remained unchanged from the rate in 2012. Although improvements may result from changes in a multitude of variables, some common factors that prevent dropout include more family engagement, increased opportunities for active learning and after-school activities, and options regarding alternative schooling.

Dropout rates vary depending on the definition of “dropout” and the range of school years or the student population of interest. Given these discrepancies, we add an additional measure—high school

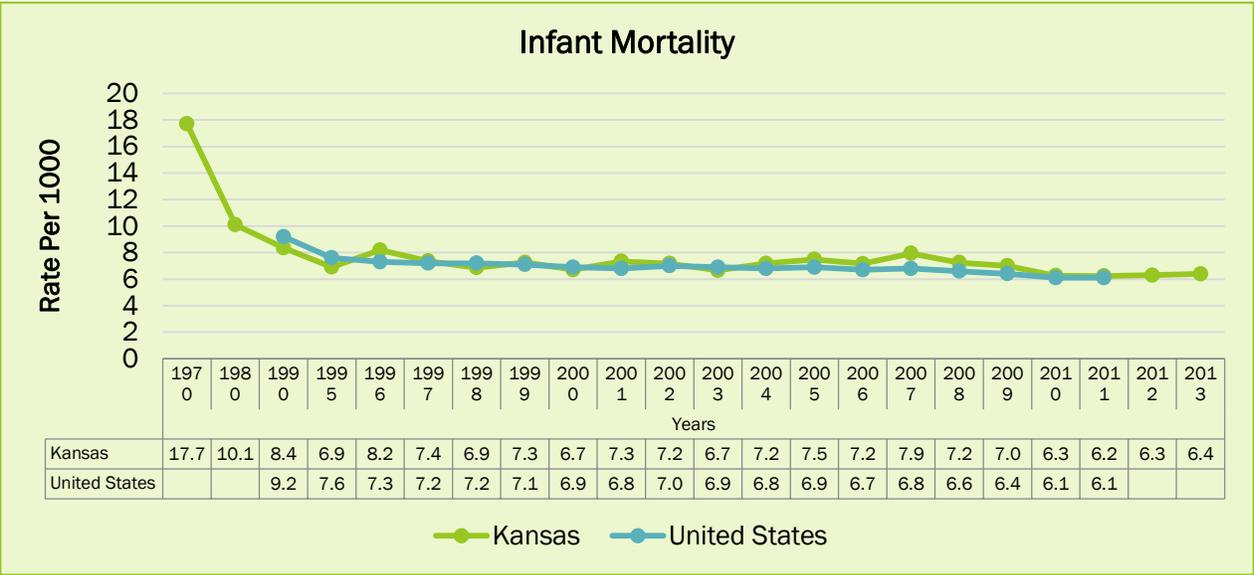

graduation. Taken together, these two measures provide information on both ends of the education spectrum. Note, however, that the high school dropout and graduation rate cannot be summed to equal 100 percent due to different measurement criteria. The following graph displays national and state-level graduation rates based on several measures of high school graduation.

- AFGR stands for average freshman graduation rate and provides an estimate of the percentage of high school students who graduate on time.
- ACGR refers to an adjusted cohort graduation rate defined as the number of students who graduate in four years with a standard high school diploma (GED not included) divided by the number of students who form the adjusted cohort for that graduating class.

Infant Mortality

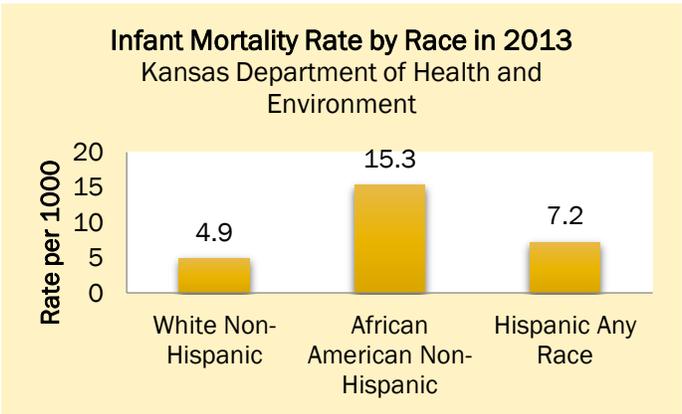

*Rates were not available for the US in 2012 and 2013.

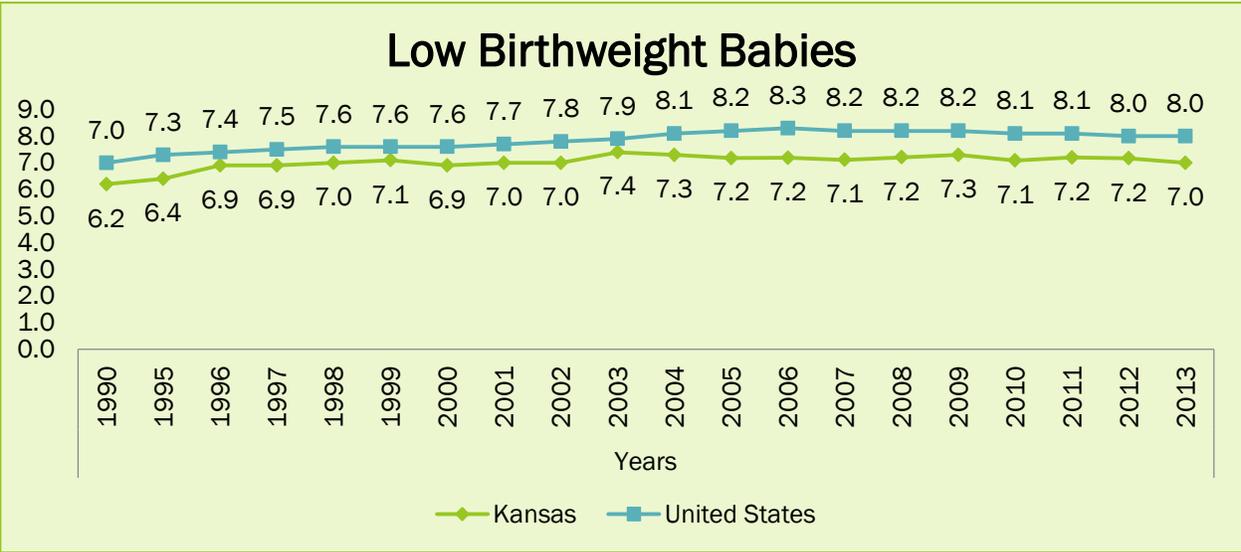

Infant mortality is linked to poor access to health care resources. Infant mortality rates are associated with lower birthweight, age of the mother, and marital status. For instance, having a teenage mother or mother aged 40–54 increases the risk of infant death within the first year of life and infant mortality rates for unmarried mothers was 77 percent higher than the infant mortality rate of married mothers.¹¹ The leading causes of infant mortality in 2010 were congenital malformations, low birthweight, sudden infant death syndrome (SIDS), maternal complications during pregnancy, and accidents.¹¹

- 6.0 deaths per 1,000 live births is the Healthy People 2020 goal.
- Individual county rates are reported in Appendix B6, p. 68. There were 22 counties in which there were no reports of infant deaths between 2011 and 2013.
- Over the same time period, the 10 counties that reported the most infant deaths per 1,000 live births were Cheyenne (12.82), Rush (12.82), Nemaha (14.93), Clark (15.15), Ness (18.23), Norton (19.36), Rawlins (22.22), Sheridan (23.57), Osborn (24.22), and Edwards (28.59).
- Rates of infant deaths among African American non Hispanic mothers have been higher than those of White non Hispanic and Hispanic

In total, there were 248 infant deaths in Kansas in 2013, or 6.4 deaths per 1,000 live births. Although a marginally higher rate, the raw number of infant deaths is six fewer than in 2012’s 254. Overall, Kansas has made progress in terms of reducing the infant mortality rate across several decades. In the state of Kansas, the rate of infant deaths has decreased by 42 percent from 1970 to 1980, by 17 percent from 1980 to 1990, by 20 percent from 1990 to 2000, and by 4.5 percent from 2000 to 2013.

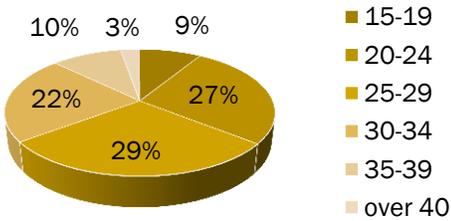

Low Birthweight Babies

Low Birthweight by Age of Mother in 2013

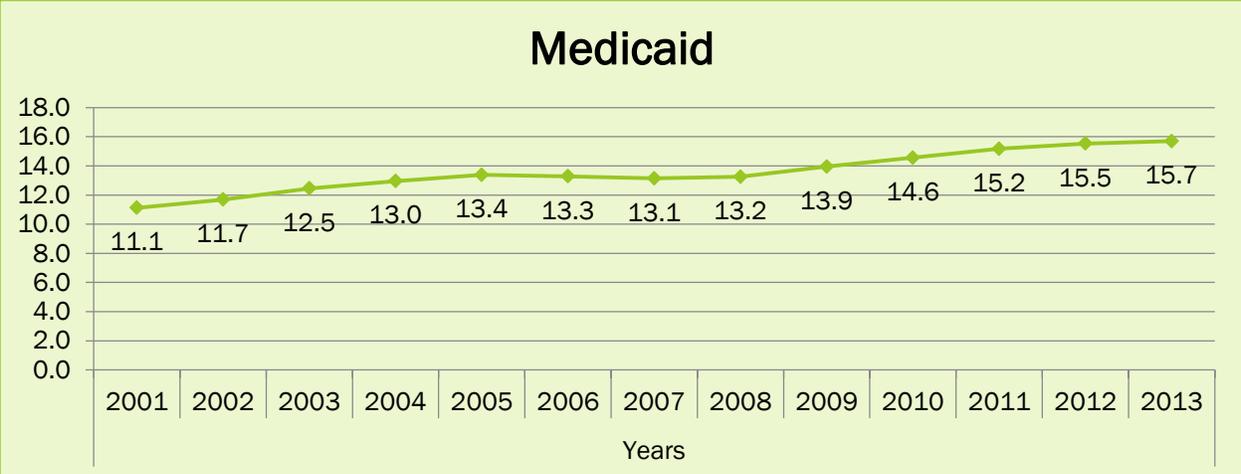

Kansas Department of Health and Environment

Of infants born in Kansas in 2013, there were 2,728 classified as low birthweight infants, defined as weighing less than 2,500 grams (5.5 pounds). The primary cause of low birthweight is pre-term delivery,¹⁷ and the use of alcohol, cigarettes and illicit drugs during pregnancy are factors that also contribute to low birthweight. Low birthweight is associated with mild issues in cognitive and neuro-motor functioning, and low birthweight consequences tend to persist into adolescence.¹⁸ Furthermore, the effects of low birthweight negatively impact children’s readiness for school.¹⁹ Low birthweight babies also come with economic and emotional costs, as low birthweight babies require additional costs for delivery and initial care and are at a higher than average risk of infant mortality.²⁰

- County level data regarding the percent of low birthweight infants using averages from 2011 to 2013, can be viewed in Appendix B8, p. 69.
- The five counties with the lowest rates of low birthweight infants were Jewell (1.1%), Greeley (1.8%), Sheridan (2.4%), Greenwood (3.4%), and Haskell (3.5%).
- The rate of low birthweight infants in 2013 (7.0%) represents a 12.9% increase from 1990.
- Kansas has had a consistently lower rate of low birthweight infants than the national average.
- In 2013, Black non Hispanic mothers were the most likely to have a low birthweight infant (13.2%). The likelihood of having a low birthweight infant for White non Hispanic mothers and Hispanic mothers was 6.7% and 5.8%, respectively.

Medicaid

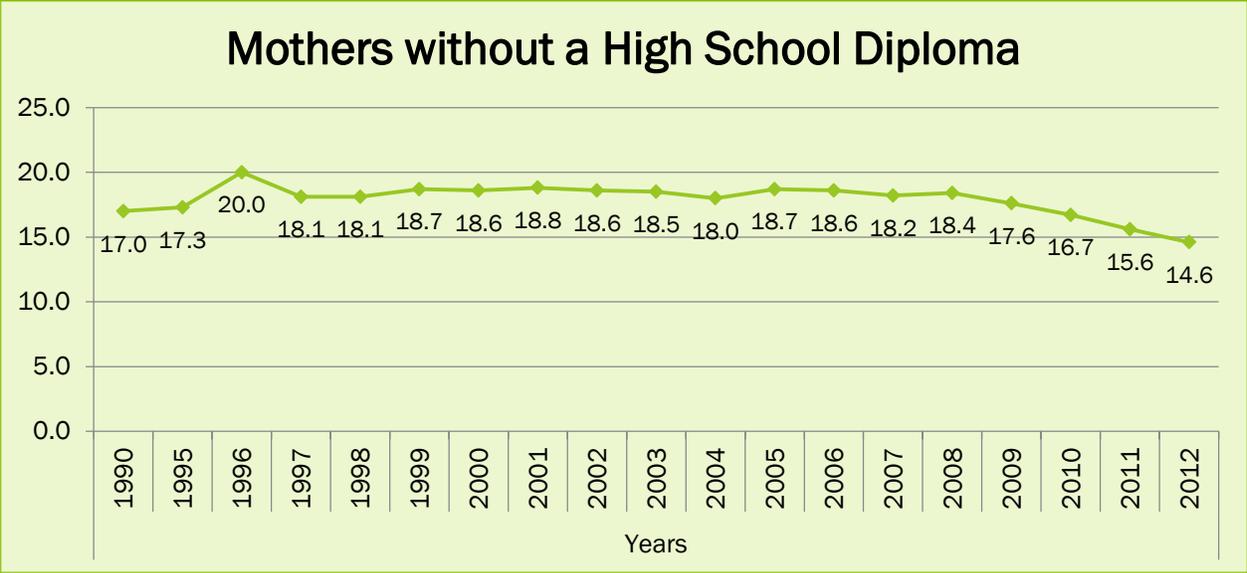

*Because Medicaid enrollment differs from state to state based on income threshold, a comparison could not be made to the national rates.

Medicaid is a government insurance program that provides health-related services for those who meet certain low-income requirements. Those who received Medicaid were 10 percent less likely to have a positive depression screen. Medicaid enrollment in the state of Kansas varies from an average of 7.06 percent to 26.91 percent across counties. Due to the low-income criteria for Medicaid qualification, it is important to consider the economic situation in each county when assessing the benefits of higher versus lower rates of Medicaid enrollment.

- The number Kansans enrolled in Medicaid has climbed each year since 2007. In 2013, 15.7% of the population received Medicaid benefits, up from 11.1% in 2001, which is more than a 40% increase.
- The proportion of Kansans receiving Medicaid coverage has increased in 9 of the last 12 years.
- County level data for Medicaid enrollment in Kansas from 2011 to 2013 were obtained and averaged; this data can be viewed in Appendix B9, p. 70.
- The five counties with the lowest proportion of individuals receiving Medicaid benefits were Riley (7.06%), Johnson (7.55%), Sheridan (7.58%), Hodgeman (9.00%), and Gove (9.11%).

Mothers without a High School Diploma

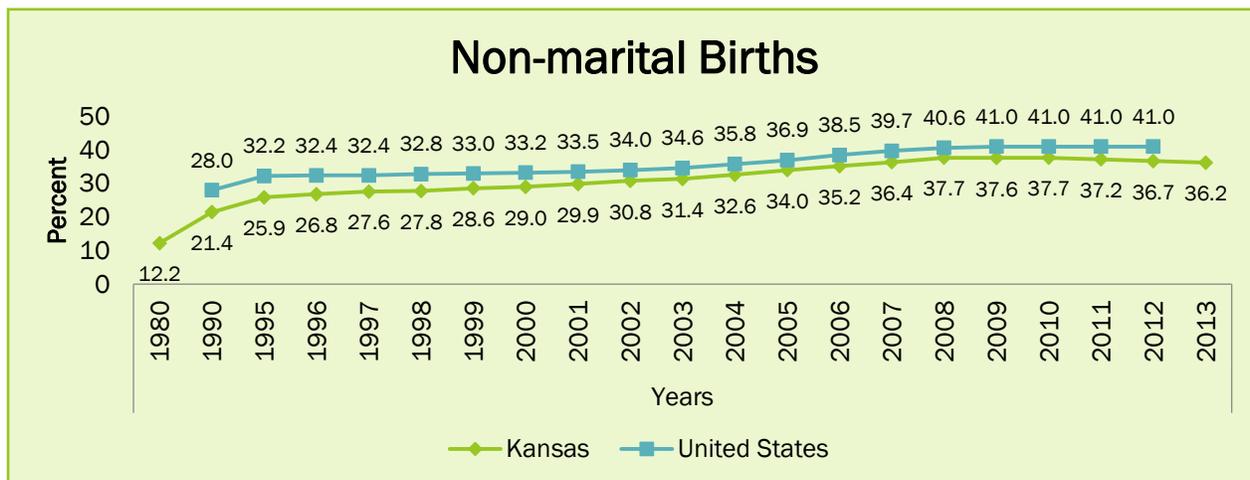

Lower levels of maternal education are associated with higher maternal mortality, infant mortality, and lower birthweight.^{12, 13} Furthermore, maternal education is related to children’s cognitive and behavioral development.¹⁴ Although maternal education likely affects child well-being indirectly, due to the socioeconomic status attained by educated women, some propose that maternal education impacts well-being directly through health-related choices that educated mothers make for

their children and the way they prepare their children for school.^{15, 16}

Data for maternal education are released later than many of the other indicators. For this report, data is available up to 2012. In 2012, the percentage of births to mothers who had not received a high school degree dropped to 14.6 percent, the lowest it has been since 1990. County-level data for the average rates from 2011 and 2012 is available in Appendix B7, p.71.

- The five counties with the lowest percentage of births to mothers without a high school degree between 2011 and 2012 were Wabaunsee (2.00%), Chase (4.35%), Gove (4.52%), Decatur (4.84%), and Nemaha (5.18%).
- Conversely, Haskell (36.67%), Finney (37.01%), Grant (38.31%), Ford (39.41%), and Seward (44.05%) were the five counties that had the highest percentage of births to mothers who had not completed high school.

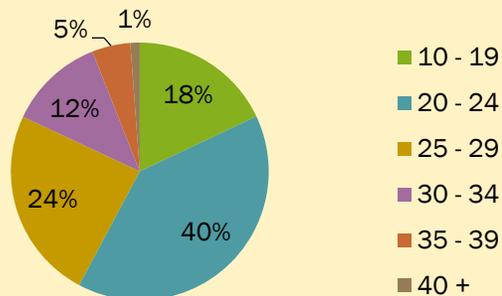

Non-marital Births

Unmarried mothers are more likely than married mothers to lack social support, be unemployed, and to use cigarettes. Each of these factors are associated with undesirable obstetric outcomes.²¹ Not surprisingly, unmarried mothers are at an increased risk for preterm birth and low

- There were a total of 14,053 non marital births in the state of Kansas in 2013.
- Although 7.4% of total births in Kansas are to teenage mothers, about 18% of unmarried births in Kansas are to teenage mothers.
- The percentage of unmarried births decreased slightly in each of the past three years.
- See Appendix B, p. 71 for county level averages from 2011 to 2013 for non marital births.
- The five counties with the lowest rates for non marital births were Kiowa (10.22%), Gove (12.38%), Pottawatomie (16.5%), Hodgeman (15.87%), and Riley (16.80%).
- Of all unmarried births in 2013, 60% were to White non Hispanic mothers, 12.56% to Black non Hispanic mothers, 22.16% to Hispanic mothers of any race, and 5.19% to mothers of another racial group.

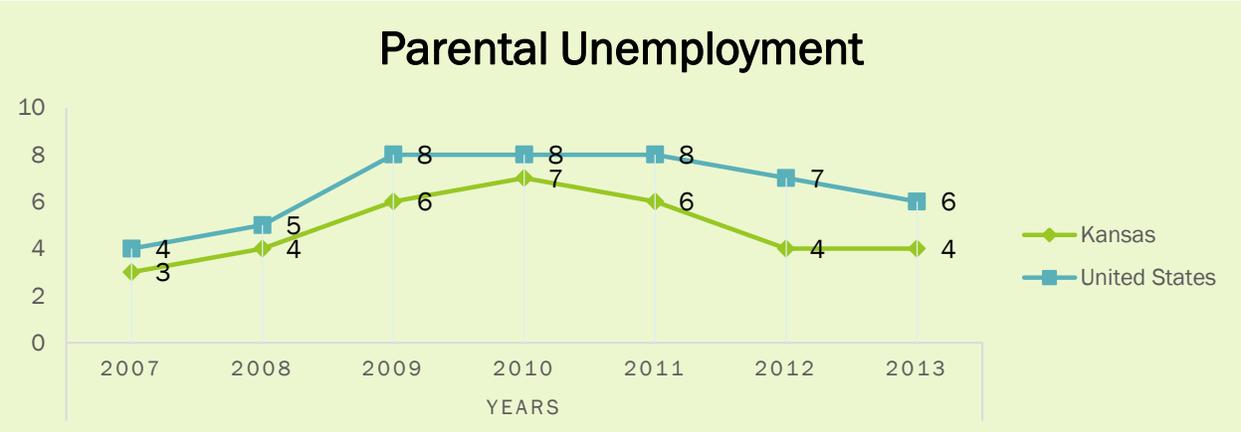

2013 Non-marital births by Age of Mother

birthweight babies, even when they are in a romantic relationship.²² Moreover, unmarried mothers are also more likely to give birth to a small-for-gestational age (SGA) infant.²³

Kansas is slowly reversing what had been a trend of higher rates of non-marital births. The percentage of births to unmarried parents has risen from 12.2 percent in 1980 to 36.2 percent in 2013, which is a 197 percent increase, but, in the past three years, there have been small decreases in the percentage of non-marital births. This is an important trend, because children born to unmarried mothers may be more likely to be challenged by poverty and to face deficits in school performance and social well-being.

Parental Unemployment

Parental unemployment is associated with behavioral problems in children as well as symptoms of depression and binge drinking in adolescents.²⁵⁻²⁷ Moreover, incidences of physical abuse and neglect of children are more common in families experiencing parental unemployment.^{28,29} Undoubtedly, having unemployed parents can negatively influence children in a number of ways.

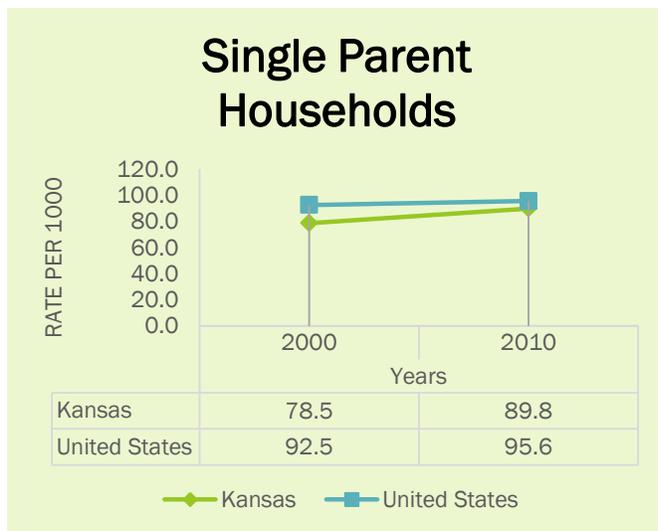

In Kansas, 22% of children in poverty are from families who do not have an employed parent. The problem of parental unemployment is more salient at a national level. Across the United States, approximately 32 percent of children in poverty do not have a parent who is employed, according to the National Center for Child Poverty.²⁴

- The percentage of unemployed parents in Kansas in 2013 was at 4%, stable from 2012 but a decrease from 6% in 2011.
- County level data regarding parental unemployment was gathered from 2010 and are reported in Appendix B9, p. 73.
- In 2010, eight counties had 0.0% parental unemployment (Chautauqua, Clay, Comanche, Greeley, Moron, Sheridan, Stevens, and Trego).
- Counties with the highest rates of parental unemployment in 2010 were Woodson (14.2%), Ness (14.8%), and Barber (15.5%).

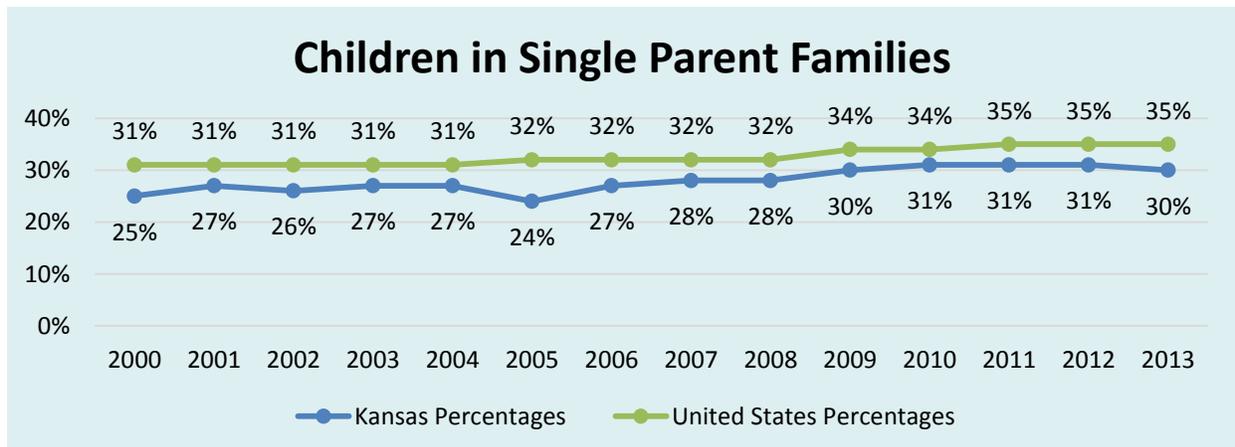

Single-parent Households

Growing up in a single-parent household can hinder children’s developmental progress. For example, children who spend time in a single-parent home tend to have more behavioral and cognitive difficulties, and they may also be more vulnerable to peer pressure.^{30, 31} Children who grow up in a single-parent home have a 50 percent greater likelihood of experiencing poverty in adulthood.³²

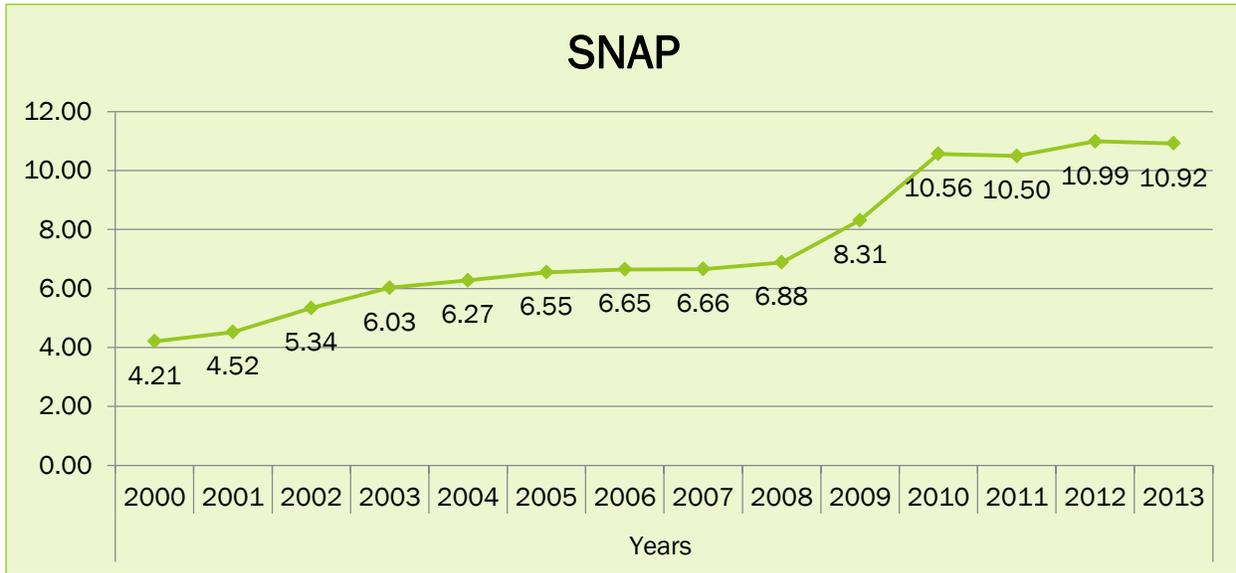

Data for single-parent households as measured in previous versions of the State of the Family Report were obtained via decennial Census data and thus, could not be updated for the current report. New data for this indicator will be available in 2020. A different measure of single-parent households was available, however, at the state and national level and is depicted in the graph below. “Children in Single-Parent Families” is defined as “children under age 18 who live with their own single parent either in a family or subfamily.” Single-parent families do include a single, unmarried parent who is cohabiting with a partner.

- In each year from 2000 to 2013, Kansas has reported a lower percentage of children in single parent families than the United States’ average.
- The rate of single parent households in Kansas was lower than the national average in 2000 and in 2010, but there was a greater increase in the rate of single parent households in Kansas between 2000 and 2010 than at the national level.

SNAP (Supplemental Nutrition Assistance Program)

* SNAP eligibility differs from state to state based on criteria determined by the state, thus, a comparison could not be made to the national rates.

Individuals receiving SNAP benefits must be of low income and unable to afford adequate nutrition. Because eligibility for SNAP is dependent on the inability to provide adequate nutritional needs to the number of individuals within a household, higher rates are indicative of poorer access to resources.

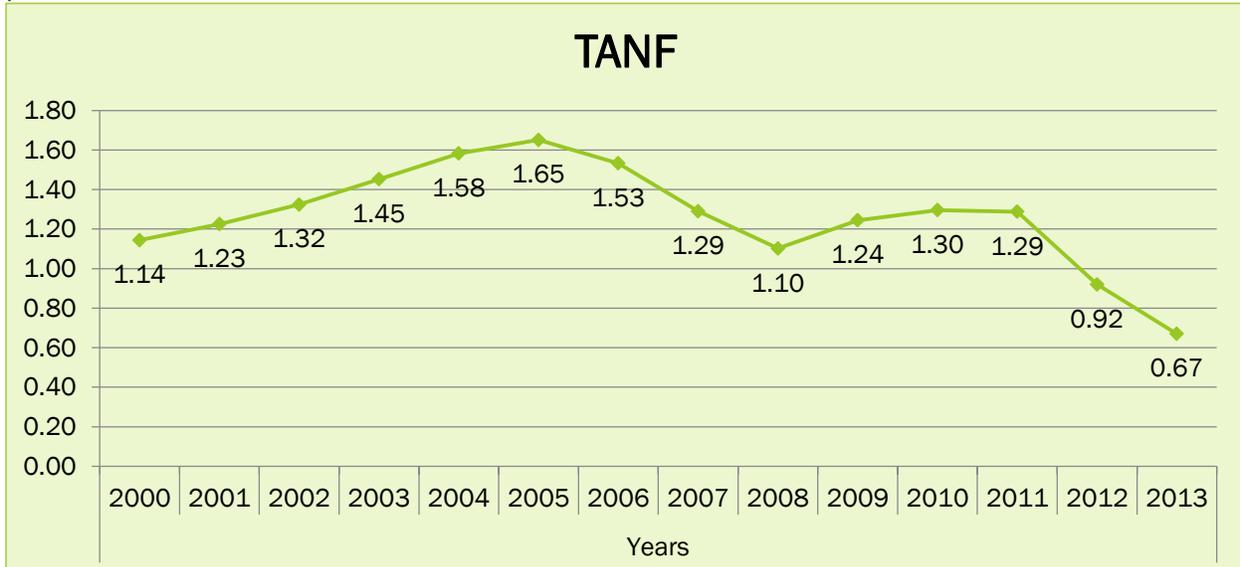

The percentage of individuals receiving SNAP benefits in Kansas has risen from 4.21 percent in 2000 to 10.92 percent in 2013; this is a 159 percent increase. There is a connection between SNAP enrollment and parental unemployment. In most years, an increase in SNAP enrollment coincides with an increase in parental unemployment.

- Kansas' largest two year jump in SNAP enrollment occurred between 2008 and 2010, when there was a 53.5% increase.
- Since the new millennium, there has only been two years in which Kansas reported a lower SNAP enrollment than the previous year. This was in 2011 and 2013, and the decreases were minimal drops from previous years.
- The counties with the largest percentage of the population receiving SNAP benefits include Crawford (16.69%), Montgomery (16.86%), Cherokee (17.45%), Bourbon (17.67%), and Wyandotte (21.38%).
- See Appendix B11, p. 75 for county level data of the three year average of SNAP enrollment from 2011 to 2013.

TANF (Temporary Assistance for Needy Families)

TANF provides families with a financial safety net; that is, families with children who are in poverty may be able to find monetary support through TANF. However, the role of TANF as a resource for vulnerable families may be shifting. From 1995 to 2010, the percentage of families in poverty has increased while the percentage enrolled in TANF has decreased.³⁴ More specifically, the national TANF caseload decreased 58 percent between 1995 and 2010; during this time period, the number of families with children in poverty increased by 17 percent.

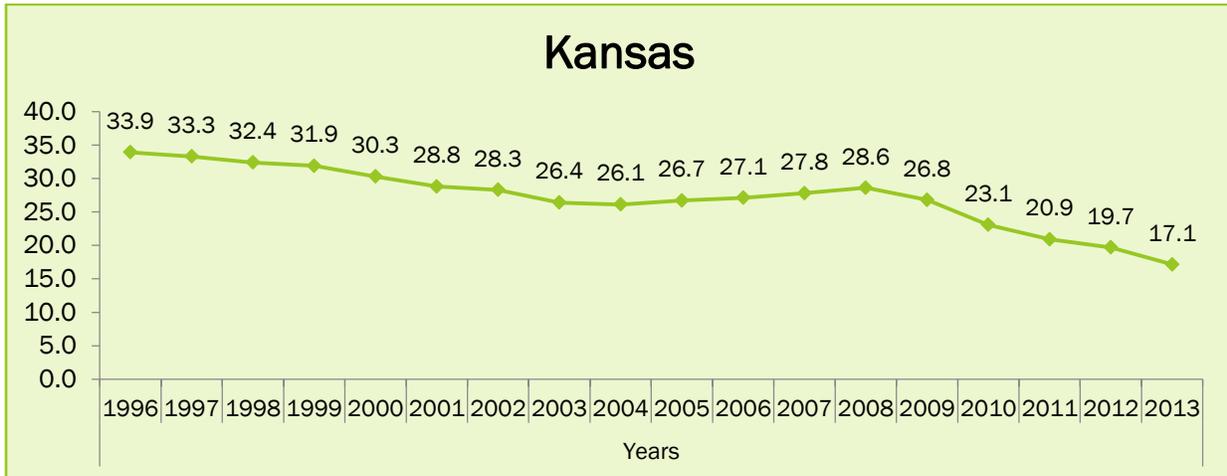

- There were four counties in which 0.2% or less of the population received TANF benefits per month, on average.
- County level data of the three year average (2011 to 2013) for TANF enrollment is available in Appendix B12, p. 76.
- The ten counties in which the largest proportions of the population received TANF benefits per month, on average, were Montgomery, Sherman, Cherokee, Neosho, Labette, Bourbon, Shawnee, Atchison, Allen, and Wyandotte. The average enrollment rate for these counties was 1.74%.

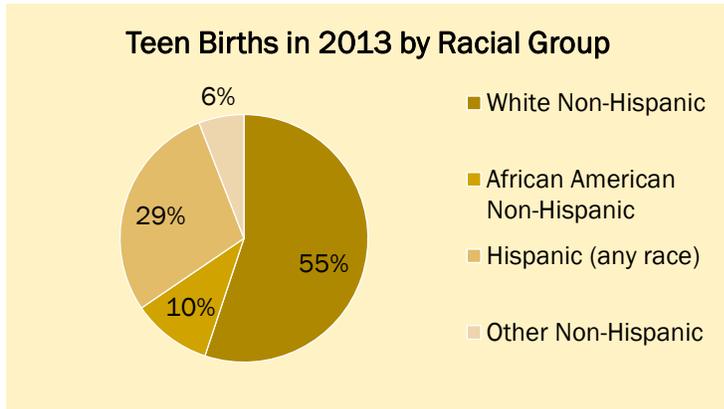

*Because TANF enrollment differs from state to state based on eligibility criteria, a comparison could not be made to the national rates.

In 2005, the percentage of Kansans who enrolled in TANF was at a high of 1.65 percent, but enrollment was 0.67 percent in 2013, the lowest ever since the new millennium. In fact, this change represents a 59.39 percent decrease.

Teen Pregnancy

*National teen pregnancy rates were calculated for 15-19 year olds and cannot be compared to the rates above for 10-19 year olds.

Teen pregnancy is associated with pre-term delivery, low birthweight, congenital malformations, neonatal mortality, and a lack of prenatal care. Pregnant teens also face an increased likelihood of maternal anemia, chest infection and urinary tract infections. It is also important to note that younger mothers tend to provide fewer opportunities for emotional and cognitive stimulation for their children as compared to older mothers. However, the rate of teen pregnancy has been decreasing across the U.S. In 2013, the birth rate for teenagers between 15 and 19 years of age dropped to 14.6 per 1,000, which is the lowest rate on record for the U.S.

The teen pregnancy rate in Kansas has improved alongside the rest of the country. The Kansas rate of teen pregnancy has decreased every year since 2009. In 2013, for every 1,000 Kansas females between the ages of 15 and 19, there were 29.6 live births, still births, or abortions. Overall, there were 3,335 teen pregnancies in 2013. The data shows, with the exception of 2008, the rate of teen pregnancies in the state of Kansas has gone down each year.

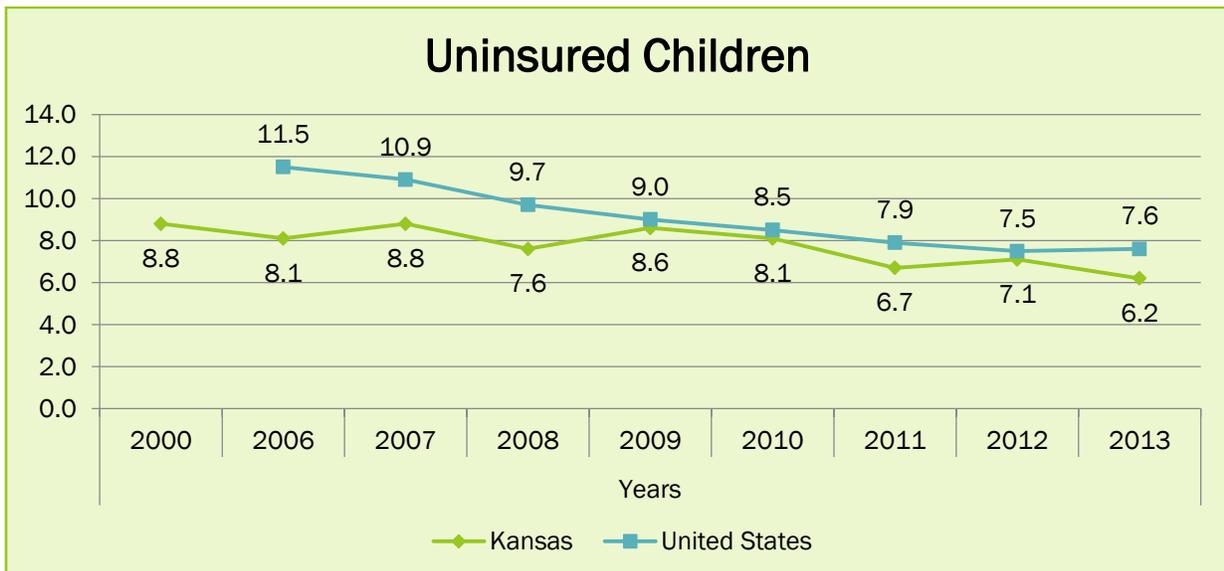

- See Appendix B13, p. 77 for county level averages from 2011 to 2013.
- Greeley had 0 teen pregnancies and the average rate of teen pregnancy amongst the ten counties with the lowest rates was 2.75 per 1,000.
- 8.2% of all live births in Kansas in 2012 were from mothers between the ages of 15 and 19.
- The ten counties with the highest average rates of teen pregnancy between 2011 and 2013 had, on average, a teen pregnancy rate of 35.8 per 1,000.
- Rates of teen pregnancy in 2013 were higher for Hispanic teens (28.7) than for African American non Hispanic teens (22.4), and Hispanic teens had a rate per 1,000 of teen pregnancy that was double the rate of White non Hispanic teens (13.4).

Uninsured Children

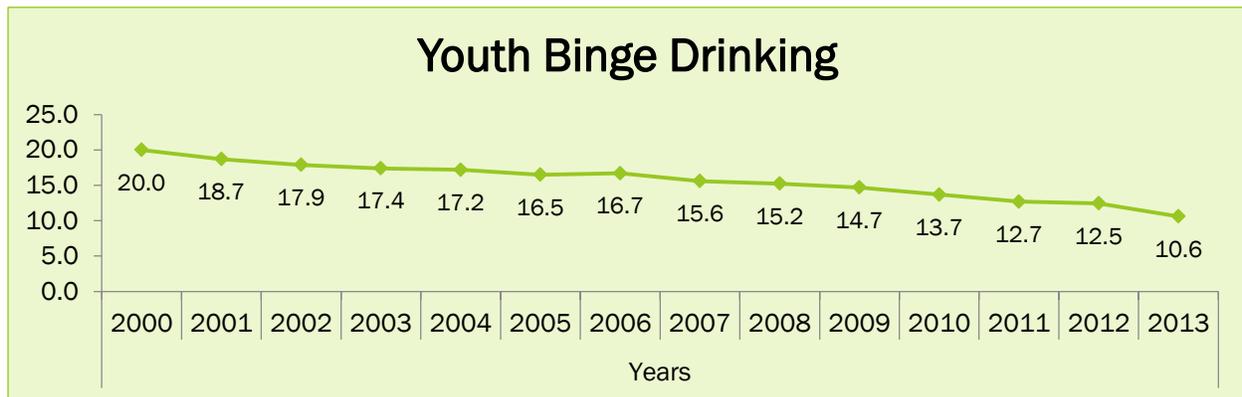

Not surprisingly, children without insurance are less likely to receive adequate health care overall, including medical care, mental health care and dental care.³⁹ Compared to insured children, uninsured children are also less likely to receive preventative care and may be less likely to receive diagnoses until later in the disease stage. In one research investigation, uninsured children who were hospitalized had a significantly higher all-cause in-hospital mortality rate.⁴⁰

The percentage of children in Kansas who are uninsured has dropped from 8.8 percent in 2000 to 6.2 percent in 2013. This is a decrease of 29.6 percent.

- County level data for the three year average (2011 to 2013) percentage of children who are uninsured is reported in Appendix B14, p. 78.
- The five counties with the highest percentage of uninsured children were Wichita, Haskell, Kearny, Hamilton and Stanton, with an average rate of 13.77%.
- Kansas has had a lower percentage of uninsured children than the national average for at least the past seven years.

Youth Binge Drinking

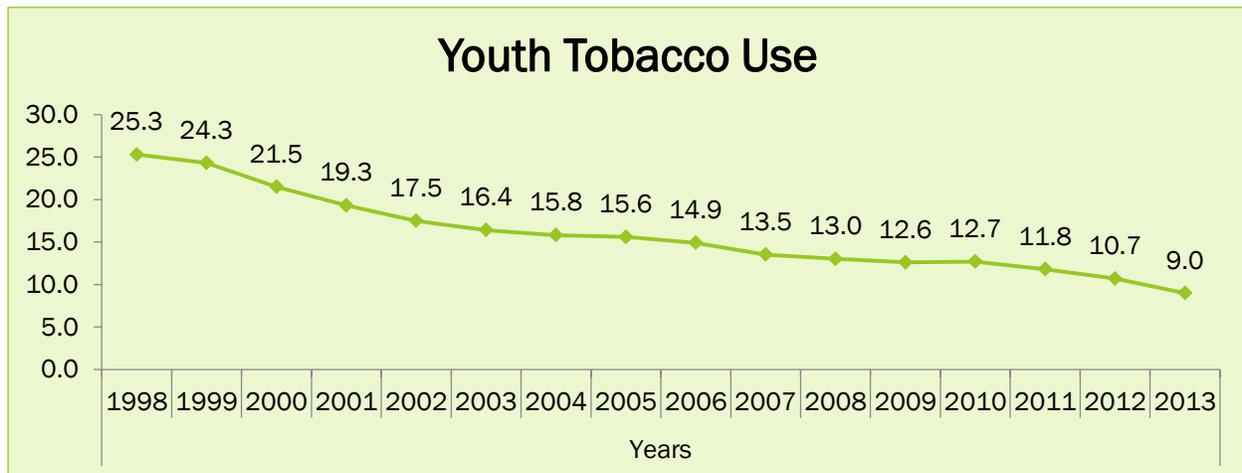

*Data on youth binge drinking were measured differently at the national level.

Data from the 2010 National Survey on Drug Use and Health study paints an alarming picture of adolescent alcohol abuse—about 6.5 million people aged 12 to 20 were classified as binge drinkers.⁴¹ Serious consequences are associated with an adolescent's use of alcohol, including school-related problems, crime, motor vehicle accidents, injuries and death. In fact, 5,000 people under 21 years of age die each year from alcohol-related incidents.⁴²

Rates of youth binge drinking in Kansas have declined nearly every year since 2000. In the current report, youths are considered those in grades six, eight, 10, and 12, and binge drinking is classified as having five or more consecutive drinks on at least one occasion in the most recent two weeks at the time of reporting.

- Rates of youth binge drinking in Kansas have declined 46.95% between 2000 and 2013, from 20.0% of Kansas youths reporting binge drinking in 2000 compared to 10.61% in 2013.
- Using data from 2011 to 2013, average Kansas county level percentages were calculated; they can be viewed in Appendix B15, p. 79.
- The rates for youth binge drinking were highest in Elk (17.49%), Neosho (18.38%), Rawlins (18.87%), Ness (19.61%), and Morton (19.51%).
- Kansas had higher rates of teen binge drinking than the U.S.' average in six of the past nine years. However, in three of the past four years, the Kansas rate of teen binge drinking has been identical to the national average.

Youth Tobacco Use

*Data on youth tobacco use were measured differently at the national level.

The health risks related to tobacco use include coronary heart disease, stroke and lung cancer.⁴³ Although teens might not be initially affected by these outcomes, early tobacco use has been found to be associated with long-term tobacco use in adulthood.^{44, 45} Ultimately, tobacco causes more preventable deaths than any other drug.⁴⁶ Studies have also indicated that tobacco use is associated with poor academic achievement and school dropout.⁴⁷ Teen use of cigarettes has also been linked to adverse mental health outcomes, including depression.⁴⁸ Moreover, cigarette use has been linked to the use of illicit substances. 2010 estimates suggest that adolescents aged 12 to 17 who reported using cigarettes were about 8.5 times more likely to report using illicit drugs compared to adolescents who reported no cigarette usage.⁴¹

- After averaging the county level data across 2011, 2012, and 2013, the 5 counties with the lowest rates for youth tobacco use were Edwards (4.5%), Wallace (6.5%), Douglas (6.62%), Ford (7.03%), and Gray (7.31%). See appendix B16, p. 80 for individual county percentages.
- The 5 counties with the highest rates of youth tobacco use were Morton, Woodson, Bourbon, Chase and Lane, with an average rate of 20.09%
- With the exception of 2006, youth tobacco use in the state of Kansas has gone down each year since 2000.

COUNTY RANKINGS ACROSS INDICATORS

APPENDICES

Appendix A: Definitions and Source for Indicators

Indicator of Family/Child Well Being	Definition	Source
CHILD POVERTY	The estimated percent of children under the age of 18 living in families with incomes below 100 percent of the U.S. poverty threshold	U.S. Census Bureau Small Area Income and Poverty Estimates Population Reference Bureau, Census 2000 Supplementary Survey, 2002 through 2012 American Community Survey
CHILDCARE ASSISTANCE	The average number of individuals per month receiving child care benefits out of the total population	Kansas Department for Children and Families
DIVORCE	The total number of divorces and annulments out of total population times 1,000.	Kansas Department of Health and Environment
FREE AND REDUCED LUNCH ENROLLMENT	Enrollment represents school total headcount enrollment as of Sept. 20 th of each year. KIDS Count data year 2014 refers to the present report year 2013.	Kansas State Department of Education & KIDS Count
HIGH SCHOOL DROPOUT	Yearly total dropouts divided by the total enrollment of grades 7-12. Dropouts are not synonymous with “not graduating.” Refer to source for additional information. Year reported refers to year in which the school year began. For example, “2012” refers to the 2013-2014 academic year.	KS Individual Data on Students System & Principal’s Building Report, Kansas State Department of Education U.S. Department of Education, National Center for Education Statistics
INFANT MORTALITY/DEATHS	The death of a live-born infant that occurs within the first year of life. Rate is calculated by the number of infant deaths divided by the number of live births times 1,000.	Kansas Department of Health and Environment & KIDS Count
BIRTHS TO MOTHERS WITHOUT A HIGH SCHOOL DIPLOMA	The percentage of live births to mothers who have not received a high school degree, as indicated on the child’s birth certificate out of total live births	Kansas Department of Health and Environment & KIDS Count
LOW BIRTHWEIGHT BABIES	The percentage of live births weighing less than 5.5 pounds out of total live births	Kansas Department of Health and Environment & KIDS Count
MEDICAID	The unique (unduplicated) number of individuals who received Medicaid benefits out of the total population.	Kansas Department for Children and Families

Indicator of Family/Child Well Being	Definition	Source
NON-MARITAL BIRTHS	A birth occurring to a mother who is not married at the time of conception or at the time of the birth or any time between conception and birth. The rate is calculated by taking the total number of non-marital births divided by total live births times 100.	Kansas Department of Health and Environment
PARENTAL UNEMPLOYMENT	Percentage of families where no parent has full-time, year-round employment. Calculated rate by taking parent(s) not in the labor force divided by families and subfamilies with own children under the age of 18 times 100	U.S. Census Bureau, Bureau of Labor Statistics
SINGLE PARENT HOUSEHOLDS	Households with only one parent present with own children divided by the total number of households times 1,000.	U.S. Census Bureau, Housing and Families
SNAP (SUPPLEMENTAL NUTRITION ASSISTANCE PROGRAM)	The average number of individuals per month receiving SNAP benefits out of the total population.	Kansas Department for Children and Families
TANF (TEMPORARY ASSISTANCE FOR NEEDY FAMILIES)	The average number of individuals per month receiving TANF benefits out of the total population.	Kansas Department for Children and Families
TEEN PREGNANCY	The total number of live births, still births and abortions to females ages 10-19 divided by total population of females ages 10-19 times 1,000.	Kansas Department of Health and Environment
UNINSURED CHILDREN	The number of uninsured children* out of the total population of children. *Children were defined as “under age 18” in 2000, but “under age 19” for 2006-2010.	U.S. Census Bureau, Small Area Health Insurance Estimates
YOUTH BINGE DRINKING	The percentage of youths in grades six, eight, 10 and 12 who reported taking five or more consecutive drinks on at least one occasion in the two weeks prior to completing the Communities that Care Survey on substance use and other social behaviors	KIDS Count & Southeast Kansas Education Service Center
YOUTH TOBACCO USE	The percentage of youth in grades six, eight, 10 and 12 who reported using tobacco products (cigarettes or smokeless tobacco) in the 30 days prior to completing the Communities that Care Survey on substance use and other social behaviors.	KIDS Count & Southeast Kansas Education Service Center

Appendix B: Individual County Rankings per Indicator

Individual county rankings represent rankings based on a three-year-average of the years 2011-2013. The averages were computed to increase stability of the measure. For some counties, data were not available for all three years. In these instances, an average of available years within the range was used. If no data were available, the county average is marked “N/A” for the specific indicator. The following tables provide county-level data for each indicator. Each indicator’s definition and unit of measurement is described.

Child Poverty

Rank	County	Average %	Rank	County	Average %	Rank	County	Average %	Rank	County	Average %
1	Johnson	7.87	29	Marshall	15.83	57	Sumner	18.60	85	Osborne	22.60

Percentage of youth in grades 6, 8, 10, and 12 who reported using tobacco products (cigarettes or smokeless tobacco) in the 30 days prior to completing the Communities that Care Survey on substance use and other social behaviors

Appendix C: Change across Indicators

The following tables depict changes in rank for each county from the 2014 report to the present 2015 report. Parental unemployment and single-parent household are not included in these tables, as they were only available at the state level or only via decennial census data and thus, were not updated from the 2014 report.

County	Child Poverty				Childcare				Divorce
